

TRIPNEXIO — BRAND FOUNDATION MASTER REFERENCE

Shared Brand + Visual Design System | Version 1.1 — SVG Source Added

22 August 2026

Version 1.1 specifically adds the documented SVG source and CSS brand-token reference. The official supplied identity remains the source of truth.

Approved visual identity reference supplied by the user. Use the official assets shown here; do not recreate the logo.

Document Status

01. Purpose & Scope

This document records the approved and proposed decisions from the TripNexio Brand Foundation phase. It is the shared visual-language reference for the future Website / Customer Portal, CRM / Staff Operations application, and Admin / Control Panel.

This phase is brand and visual design only. It does not redesign application functionality, change business requirements, define service-specific statuses, or authorize production coding.

02. Product Ecosystem Boundary

TripNexio consists of three connected applications: Website / Customer Portal, CRM, and Admin. The governing principle is: Admin controls/configures; CRM operates; Website serves the customer.

CRM and Admin are separate applications with separate access/authentication. CRM consumes Admin-controlled configuration rather than duplicating global configuration controls.

03. Brand Personality

TripNexio should feel: GLASSY, LIGHTWEIGHT, SIMPLE, CLEAN, UNIQUE, PROFESSIONAL, EASY TO UNDERSTAND, MODERN, PREMIUM, OPERATIONAL, NOT HEAVY, NOT CLUTTERED.

Brand personality: TRUST, SPEED, CLARITY, CONTROL, SIMPLICITY, PROFESSIONALISM, TRAVEL, RELIABILITY.

Avoid: childish UI, overly corporate UI, generic banking software, generic CRM/SaaS, gaming UI, overly futuristic UI, and visual noise.

04. Core Design Principles

Function first. Beauty second. Both should work together.

Glass creates hierarchy; it does not create decoration.

Operational information must remain highly readable.

Adapt layouts responsively rather than simply shrinking desktop layouts.

The three applications share brand, tokens, typography and primitives, but do not share identical information architecture or workflows.

05. Final Logo & Brand Asset Rules

The user's supplied final logo sheet is the visual source of truth for the TripNexio logo system.

Approved asset families shown in the supplied identity sheet: primary logo / wordmark, dark/reverse treatment, symbol-only mark, wordmark-only treatment, app icon and favicon variants, plus documented clear-space and minimum-size guidance.

Do not redraw, retype, distort, stretch, recolor, add effects to, or otherwise modify the official logo asset. The logo typography is a brand asset and is not to be recreated with Inter.

Minimum-size guidance shown in the supplied identity sheet: symbol 16px minimum; lockup 120px+ recommended width. These values should be revalidated against the actual production asset before implementation.

The supplied logo sheet includes a possible descriptor / tagline. Treat descriptor wording as brand-asset content only where explicitly approved; do not convert it into a product requirement.

06. Locked Brand Colors

Deep Navy — #182A4D

Electric Blue — #3E6FDB

Warm White — #F7F5F0

Ink Black — #111318

These four colors are the locked TripNexio brand foundation. They are brand tokens, not the entire UI palette.

07. Color Token Architecture

Brand tokens remain fixed. A separate UI-token layer will provide neutral, surface, interactive, border, text, status and glass semantics.

Neutral ramp: warm-neutral values for canvas support, borders, dividers, disabled states, placeholders, table surfaces, hover states and skeletons. Exact hex values remain a validation item until contrast testing is completed.

Blue ramp: tonal variations around Electric Blue so the brand blue is not overloaded with every interactive meaning. #3E6FDB remains the approved brand blue.

Semantic status families: Neutral, Info, Active, Success, Warning, Error. Actual service-specific business status names and mappings remain outside this brand foundation.

Surface tokens: Warm White canvas, white/default surfaces, soft surfaces, elevated surfaces, and inverse Deep Navy surfaces.

Text tokens: Primary, Secondary, Muted, Placeholder, Disabled, Inverse.

Border tokens: Subtle, Default, Strong, Focus, Selected.

08. Typography System

UI font direction: Inter. Inter is the shared product/UI typeface candidate for Website UI, CRM and Admin because it supports readable forms, tables, numbers and dense operational data.

Logo typography is not recreated with Inter; the official wordmark asset is used exactly as supplied.

Website display typography: initially use the shared UI family and only introduce a second display face if visual validation shows that the Website needs additional expressive distinction. A second display font is optional, not mandatory.

Weight system: 400 Regular, 500 Medium, 600 Semibold, 700 Bold used sparingly.

Website scale direction: Display 48–56px; H1 40–48px; H2 28–32px; H3 20–24px; Body Large 16–18px; Body 14–16px.

CRM/Admin dense scale direction: Page title 20/28; section 14–16/20–24; body 14/20; table 13/18; metadata 12/16; status 12/16 at 500; KPI 28–32px/36–40px.

13px table text is a practical operational floor, not a target to shrink below. Fix information architecture before reducing type further.

09. Spacing & Grid

Base spacing unit: 4px. Core rhythm: 4, 8, 12, 16, 20, 24, 32, 40, 48, 64.

Desktop grid: 12 columns. Tablet: 8 columns. Mobile: 4 columns.

Website can use more generous card padding and section spacing. CRM/Admin should use tighter operational density, typically 12–16px internal card padding where data density requires it.

Table row heights, final desktop gutters and density controls remain Figma validation items rather than fixed business requirements.

10. Glass System

Three glass levels: Glass 01 — subtle surface separation; Glass 02 — elevated hierarchy; Glass 03 — floating/overlay surfaces.

Prototype starting values: Glass 01 approximately 82–90% surface opacity with ~8px blur; Glass 02 approximately 88–94% opacity with ~12px blur; Glass 03 approximately 92–97% opacity with ~16–20px blur. These are prototype values, not final accessibility-certified values.

Use a soft 1px translucent border and restrained elevation. Avoid heavy black shadows and strong gradients.

Hard rule: never sacrifice readability for glass. Dense tables, dense forms and important operational information should remain solid or highly opaque.

Do not stack multiple glass layers unnecessarily. A strong overlay should contain mostly solid/readable inner content.

Website can use Glass 01–03 more freely. CRM primarily uses solid surfaces with selective Glass 01 and Glass 03 for drawers/modals. Admin uses glass most sparingly, primarily for floating/overlay surfaces.

Dark glass requires a separate recipe from light glass and must be validated independently.

11. TripNexio Signature — Journey / Route Language

The distinctive visual signature is Journey → Progress → Destination, expressed as a subtle route/path language rather than generic airplane, globe or passport decoration.

Use it selectively in timelines, progress indicators, meaningful loading states, empty states, status progression and key Website journey moments.

Website: more expressive. CRM: subtle and operational. Admin: restrained and control-oriented.

Do not place route graphics behind every card, in every button, across navigation, around tables, or as decorative wallpaper.

The supplied N symbol already contains a distinctive diagonal connection and Electric Blue point. The UI signature should echo the concepts of connection, movement and destination without redrawing or modifying the logo.

12. Surface & Elevation Language

The visual hierarchy is: neutral foundation → brand structure → interaction → semantic state → selective glass/elevation.

Soft rounded surfaces should feel premium but not oversized. Operational cards should remain compact enough for high-volume workflows.

Radius direction: soft, consistent rounded geometry. Proposed component radius family includes approximately 4, 8, 12, 16 and 24px, with final component mapping validated in Figma.

Avoid excessive borders, giant shadows, oversized cards and unnecessary visual noise.

13. Core Component System

Shared primitives: Buttons, Inputs, Selects, Search, Tabs, Checkboxes, Radio, Switches, Date controls, Dropdowns, Tooltips, Cards, Status badges, Alerts, Toasts, Modals, Drawers, Pagination, Loading, Empty, Error and Confirmation states.

Shared data patterns: Tables, KPI cards, Charts, Timeline, Document states, Passenger/PAX cards, Booking status visualization.

Strengthened shared patterns: Journey/Status Timeline, Document State component, Command/Search foundation, and a composable Card primitive with controlled slots.

Component states: Default, Hover, Active, Focus, Disabled, Loading, and Error where applicable.

Avoid component proliferation. Prefer shared primitives plus app-specific patterns rather than creating many unrelated card types.

14. Feedback & System Messaging

Four primary feedback families: Info, Success, Warning, Error, plus Neutral where appropriate.

Toast = something happened. Alert = something the user needs to know. Modal = the user needs to decide something.

Error messages should explain what happened and, when known, what the user can do next.

Success feedback should be calm and dependable rather than celebratory or animated heavily.

Empty states must distinguish first-use empty, filtered/no-results, and loading/error conditions.

Permission-denied messaging should not expose sensitive configuration details.

15. Status System

Status visuals use semantic categories, not hardcoded business rules: Neutral, Info, Active, Success, Warning, Error.

Status must never rely on color alone. Use text and, where useful, an icon.

Service-specific status names and customer-safe mappings remain controlled by functional/Admin requirements, not by this visual foundation.

16. Data Visualization

Charts should be clean, lightweight, readable and restrained.

Use Electric Blue as the primary visual series with related navy/blue tonal variations for secondary comparative data. Semantic colors are reserved for status-driven meaning.

Avoid 3D charts, heavy gradients, decorative shadows and rainbow palettes.

KPI cards carry numeric emphasis; sparklines/minimal trends are preferred where a full chart is unnecessary.

State/progress visualization such as timelines and inline progress can be more useful and more distinctive for TripNexio than generic chart decoration.

17. Responsive System

Breakpoints: Mobile <640px; Large Mobile 640–767px; Tablet 768–1023px; Laptop 1024–1279px; Desktop 1280–1535px; Large Desktop 1536px+.

Website is strongly responsive. CRM/Admin prioritize desktop and tablet operational workflows while remaining responsive where appropriate.

Website mobile should be intentionally designed, not a shrunken desktop. Source Website frames include 1440px, 1280px, 1024px, 768px, 390px and 375px.

CRM/Admin tables should adapt by priority: full tables on desktop, reduced/controlled columns on tablet, and condensed records/cards or carefully controlled horizontal scrolling on mobile where tabular comparison requires it.

18. Accessibility Rules

Readable contrast is mandatory for all text and controls. Electric Blue must be contrast-tested before use as small text on Warm White.

Focus treatment uses the Electric Blue family and must remain visible on light, dark and glass surfaces.

Interactive targets should generally provide approximately 44×44px touch areas on mobile.

Status meaning must be communicated with text/icon in addition to color.

Forms require persistent labels, clear helper/error text and understandable validation.

Modals and drawers require keyboard navigation and focus management.

Support reduced motion. Animation must not be the only way to communicate state.

If glass reduces readability, increase opacity or remove glass. Never solve contrast problems by making text smaller or lighter.

19. Website / CRM / Admin Visual Distinction

Website: customer-focused, more expressive, more generous spacing, selective imagery, fuller glass system and more visible journey language.

CRM: staff operational workspace, compact, scannable, information-dense, minimal imagery, mostly solid surfaces and selective glass.

Admin: configuration/control/governance environment, precise and restrained, structured tables/forms, minimal decorative glass and strong hierarchy.

Shared: brand colors, logo assets, typography family, component primitives, status semantics, spacing logic, glass vocabulary and accessibility rules.

Not shared: identical navigation, identical page templates, identical workflows, identical density or identical use of imagery.

20. Functional Context Boundaries

Website serves customer acquisition, quotation, payment, documents and updates. Its design-system requirements include reusable service cards, buttons, inputs, selects, date picker, passenger selector, upload card, status step, timeline, alerts, notifications, FAQ, modal, AI assistant and payment summary.

CRM operates daily staff workflows including leads, quotations, payment links, bookings, customers, PAX, documents, OCR results, service workflows, vendors, communications, refunds, follow-ups, reports, knowledge base/help, timelines and AI-assisted drafting where enabled.

Admin controls/configures platform settings, permissions, roster, pricing, vendors and governance. CRM must consume Admin configuration rather than duplicate global Admin controls.

These functional boundaries are contextual references for visual density and component priorities. They do not constitute new business requirements in this brand document.

21. Figma Organization — Brand Foundation

Recommended foundation pages: 00 Cover / Principles; 01 Design Tokens; 02 Components; 03 Visual Language; 04 Logo & Brand Assets; 05 Typography; 06 Color; 07 Glass; 08 Data & Status; 09 Responsive / Accessibility; 10 Website Shell Preview; 11 CRM Shell Preview; 12 Admin Shell Preview; 13 Validation; 14 Reference / Inspiration.

The existing Website Figma specification separately defines Website Desktop, Website Mobile, service journeys, Track Status, AI, payment/summary, document upload, notifications, responsive states and prototypes. That application design should begin only after Brand Foundation approval.

22. What Is Locked vs Proposed

LOCKED: official TripNexio logo assets; four approved brand colors; shared platform/app distinction; brand personality; restrained glass philosophy; Journey/Route signature direction; shared UI-font direction using Inter; accessibility-first principle.

PROPOSED / VALIDATION: exact neutral hex ramp; exact blue ramp; exact semantic color values; final glass opacity/blur values; final radius mapping; table row heights; final Website display-font decision; exact motion timings; exact focus-ring measurements.

NOT PART OF THIS DOCUMENT: service-specific business statuses, pricing rules, refund formulas, production integrations, permissions logic, or application-specific business workflows.

23. Brand Foundation Approval Gate

Before declaring Brand Foundation v1.0 final, validate: (1) logo integrity, (2) visual distinctiveness, (3) consistency across Website/CRM/Admin, (4) readability and operational density, (5) accessibility, and (6) scalability of the token/component architecture.

The visual shell preview is a validation artifact, not a full application design. Full Website, CRM and Admin Figma work begins only after Brand Foundation approval.

24. Source-of-Truth Hierarchy

For business rules: the approved functional documents and service-specific requirements remain authoritative.

For Website visual/UI direction: the Website Figma UI/UX specification is authoritative for Website design-system direction, while service MDs remain authoritative for business rules.

For brand identity: the user's supplied final logo/identity sheet and approved brand tokens are the visual reference.

For production implementation: approved functional documents + approved Figma should become the source of truth; prototype HTML is not the final source of truth.

25. Future Change Control

Any future change to the brand colors, logo, typography foundation, glass philosophy, core component behavior or shared visual language should be reviewed against this document before being introduced into Website, CRM or Admin.

Application-specific design may extend the system with new patterns, but should not silently create a parallel brand palette or duplicate global design tokens.

New business functionality must come from the functional/product documents, not from the Brand Foundation.

Appendix A — Supplied Symbol Reference

This image is the supplied TripNexio symbol reference used during the Brand Foundation phase.

Appendix B — Key Design Rules at a Glance

- Use the official logo asset. Never recreate it with a UI font.
- Keep #182A4D, #3E6FDB, #F7F5F0 and #111318 as the brand foundation.
- Use Warm White as a meaningful canvas identity.
- Use Electric Blue deliberately; do not make every semantic state blue.
- Glass creates hierarchy; it does not replace structure.
- Dense CRM/Admin data stays solid and readable.
- Use Journey / Route language subtly to express connection, progress and destination.
- Website can be expressive; CRM is operational; Admin is precise and restrained.
- Status meaning must not depend on color alone.
- Do not begin full application design or production coding until Brand Foundation approval.

Appendix C — Official SVG Source & Brand Tokens

The source identity PDF documents the following Symbol source (SVG). It is preserved here as documented rather than silently corrected or redrawn.

```
<svg sc-camel-view-box="0 0 100 100" width="48" height="48">
  <path d="M26 76 L26 24 L74 76 L74 24" fill="none"
    stroke="#182A4D" stroke-width="9"
    stroke-linecap="round" stroke-linejoin="round"/>
  <circle cx="50" cy="50" r="7" fill="#3E6FDB"/>
</svg>
```

Approved CSS Brand Tokens

```
:root {
  --tripnexio-deep-navy: #182A4D;
  --tripnexio-electric-blue: #3E6FDB;
  --tripnexio-warm-white: #F7F5F0;
  --tripnexio-ink-black: #111318;
}
```

Asset Manifest

- tripnexio-symbol.svg — exact symbol SVG source referenced by the brand asset package.
- tripnexio-symbol-dark.svg — dark-background symbol variant; verify against the approved master asset before production.
- tripnexio-favicon.svg — symbol-based favicon source; export required sizes from the approved symbol.
- Full wordmark/lockup SVG source was not available as machine-readable source in the parsed PDF; use original approved vector assets if available.
